## Experiment 16: Create a Cloning of a VM and Test it by loading the Previous Version/Cloned VM

# Aim

To create a clone of an existing Virtual Machine (VM) using Type-2 virtualization software and test it by loading the cloned VM.

# Procedure

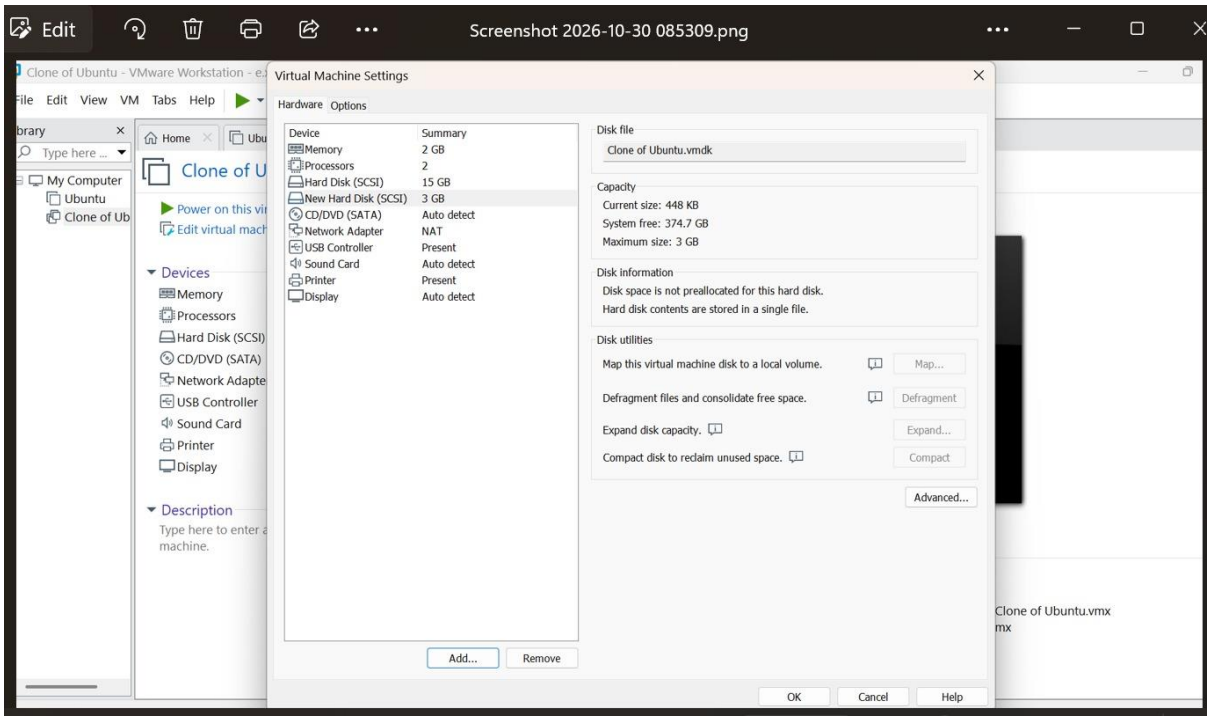

- Open Oracle VM VirtualBox.
- Select the previously created Virtual Machine.
- Right-click on the VM name.
- Select Clone.
- Enter a new name for the cloned VM (e.g., Ubuntu VM Clone).
- Select Full Clone.
- Choose the option Reinitialize the MAC address of all network cards.
- Click Next and then Finish.
- Wait until the cloning process is completed.
- The cloned VM will appear in the VirtualBox list.
- Select the cloned VM and click Start.
- Verify that the cloned VM loads successfully.

# Input

| | Value |
|---|---|
| Virtualization software | Oracle VM VirtualBox |
| Original VM | Ubuntu VM |
| Cloned VM | Ubuntu VM Clone |
| Clone type | Full Clone |

| | |
|---|---|
| CPU | 1 |
| RAM | 2 GB |
| Storage | 15 GB |

# Output

# Result

Thus, the cloning of a Virtual Machine was successfully performed using Oracle VM VirtualBox, and the cloned VM was tested by starting and loading it.
